

Festool Kapex Modificatons by Gordon Dalby

I had trouble cutting small pieces on my Festool Kapex so I made a modification to the support wings. Took two pieces of 1/2" Corian and cut them 12 1/2" long X 4 1/2" tall and shaped them like the wings (making the smaller ends longer so I could get them closer to the blade). Then I sanded them to 11/32" (8.33mm) thickness so that the hold down would still function. Mounted them with 2 screws each.

I have also replaced the cheap cardboard strip in the base with a piece of Corian that is 1 29/32" X 13 13/16" (sanded to 6.81mm (19/64") thickness). This gives a much firmer base to hold the small pieces on.
